

# Design Overview

Function	Dig holes in situations where a trowel is too inefficient and a shovel too unwieldy
Body Fit	All grips are 1" in diameter and rubberized for a comfortable fit, and the length is adjustable for body size
Form	Nothing unnecessary is added to the tool; the form is entirely dependent on its function and body fit
Materials	Rubber handles and hydroformed aluminum
Sustainability	The product is made durable for a long life with a minimal amount of material, and hydroforming leaves little waste

Using biomimicry and ergonomics, my "Garden Spork" endeavors to be a more efficient gardening tool, filling the void between trowels and full-size shovels.

In the process of transplanting, it will be most useful in digging a new hole, although it is also useful for other digging tasks.
